

1.Can we apply more than one css class to html tags? If Yes, how to implement?

-Yes, we can apply more than one CSS class to HTML tags. To implement this, we simply separate the class names with a space in the class attribute of the HTML tag.

-For example, the following HTML code applies two CSS classes, my-class and another-class, to the <div> tag:

```
<div class="my-class another-class">  
  This is a div element with two CSS classes.  
</div>
```

-We can then style these classes in our CSS file:

```
CSS  
.my-class {  
  color: red;  
}  
  
.another-class {  
  background-color: blue;  
}
```

-This will result in the <div> element being displayed with red text on a blue background.
